Integration of BioLogic Potentiostat with Hiden HPR-40 DEMS Mass Spectrometer

Cable connection allows Biologic EC-lab to send Trigger, Current and Potential to Hiden Software

Reading Potential (Ewe) into HIDEN Software

Potential (Ewe) is available as Analog output using the E monitor pin of the BioLogic DB9 connector. This voltage is sent to Auxiliary 1 of the HIDEN RC Interface and can be read in all HIDEN software. The output signal is reversed with respect to EC-lab measured values.

The E monitor facility has a voltage range of ±2.5V centered on the starting voltage of a test. If a test is run that has a voltage spread of more than this range then the monitor will not send correct voltage to the HIDEN software. It would be possible to cover a wider voltage range by running tests in series.
The Auxiliary Input must first be set up in MASsoft 10 software using the ‘Configure Auxiliary Inputs’ option available from the ‘Instruments’ menu.

After re-interrogation, ‘Potential_(Ewe)’ will be available as an input device in MASsoft 10 and can be added as an external input to QGA or EGA software.

**Reading Current (I) into HIDEN Software**

Current (I) is available as Analog output using the I monitor pin of the BioLogic DB9 connector. This voltage is sent to Auxiliary 2 of the Hiden RC Interface. The current to voltage conversion depends on the I range selected. For a standard board this is +/- 1V.

After re-interrogation, ‘Current_(I)’ will be available as an input device in MASsoft 10 and can be added as an external input to QGA or EGA software.
Setting up a Trigger to Start Hiden Software

The Trigger Out signal is sent from EC-lab to Hiden software to start and stop scans.

The trigger should be set up in an EC-Lab experiment with Trigger Out (TO) at the start of the Experiment. TO should be with 'Falling Edge'. The Trigger duration must be set to be > experiment time (including rest). A new experiment cannot be started until the previous trigger duration has elapsed.

Use an event sequence in MASsoft or set QGA or EGA software to 'Trigger on high' (default for EGAsoft).

The HIDEN software scan should be set to ready mode by pressing Start in the software.
In EGAsoft the scan will wait 'on Trigger Start'.

The scan can be started and stopped manually using the Trigger Override button.
The EC-Lab experiment can then be started and the Hiden software will begin at the same time. When the TO duration time is reached the scan will stop.
If EGAsoft is used to create a sequence then the scan can be stopped and started again by setting up multiple Trigger Out's in EC-lab.
